We only use Paulownia timber produced from sustainable forests

In order to help reverse climate change the Paulownia tree's ability to capture up to 10x the amount of CO2 of any other tree makes it the ideal tree to plant to produce sustainable timber .

Paulownia panels, ply, laminated, planed & rough sawn timber

Paulownia wood is exceptionally **lightweight yet extremely strong**, Paulownia offers a unique combination of properties that make it superior to many traditional timbers across a wide range of applications.

The Paulownia tree itself is one of the most sustainable timber sources in the world. It can **capture up to 10 times more CO₂** and **produce 4 times more oxygen** than most other tree species. Its ability to **regenerate from the stump after harvesting** makes it an ideal choice for sustainable forestry and long term timber production.

With a **high strength to weight ratio**, Paulownia is perfectly suited for applications requiring a material that is both light and structurally reliable. Its **low shrinkage coefficient** gives the dried timber exceptional dimensional stability. It is naturally **water resistant**, highly stable, and able to withstand breakage and deformation.

Paulownia's smooth texture and lack of knots or blemishes make it a preferred material for fine carpentry and high-quality manufacturing. Because the sap is **not resin or gum based**, finishing products can be applied without risk of adverse reactions. Its fine grain allows for excellent adhesion of **glue, stain, and paint**, resulting in a consistently high quality finished surface.

Visually, Paulownia can resemble oak, offering a **sustainable and cost effective alternative** in many applications where appearance and performance are important.

The wood is easy to work with and resists **splintering, cracking, and splitting**, making it ideal for a wide range of carpentry uses. Its strength-to-weight performance compares favourably with many other timber species.

With an **auto ignition temperature above 400°C**—compared to around 220°C for most hardwoods, Paulownia also offers significantly improved fire performance, with a flame spread rate well below many building code thresholds.

Paulownia is naturally **resistant to insects, pests, and rot**, and is particularly unattractive to termites, making it an excellent choice for regions where termite damage is a concern.
